AAC97991 to AAC98763 encode the human colon cancer associated proteins, called human colon cancer antigens, given in AAB5234 to AAB54006. The human colon cancer antigens can have cytostatic, cardioactive, muscular; neuroprotective, immunomodulatory, gynaecological, gastrointestinal, vulnerary, nephrotropic, antiinfective and antibacterial activities, and can be used in gene therapy. The colon cancer antigen polymucleotides, proteins and antibodies to the proteins are useful for the prevention, treatment and diagnosis of colon disorders, such as colon cancer. The polymucleotides may be used in diagnostics and research, such as for chromosome identification, and as hybridisation probes. The proteins may also be used to prevent diseases such as neural disorders, immune system disorders, muscular disorders, reproductive disorders, immune strength and cardiovascular disorders, reproductive disorders, immune diseases, and cardiovascular disorders. AAC98764 to AAC98772 and AAB54007 represent sequences used in the exemplification of the present

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            8
                                                                                                                                                                                                                                                                               The present sequence is cell cycle regulation protein-5 (CECRP-5). Blast analytical method was used to identify this protein. CECRPs are activacrs of cell proliferation or inhibitors of cellular processes that modulate proliferation. They are used to treat or prevent cell proliferative diseases like cancers, atherosclerosis, cirrhosis, hepatitis, psoriasis, immune system disorders (e.g. acquired immune deficiency syndrome, allergy, asthma, Crohn's disease, rheumatoid arthritis). Antibodies are raided socreen for specific binding agents. The corresponding nucleic acid is used in gene therapy, chromosomal mapping and isolation of related sequences.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 101

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    g
                                                                                                                                                                The invention provides the primary nucleotide sequence of the WSBV genome (AAH62689), predicted transcript sequences (AAH62689-AAH62839) and encoded proteins (AAG8940-AAG85051) and oligonucleotide sequences (AAH62840-63160) suitable for use as primers or probes. The nucleic acid molecules and proteins of the invention are useful for diagnosis and monitoring viral infection, in screens for antiviral agents and for monitoring viral gene expression or activity during a treatment regimen. The nucleic acid molecules are also useful as antisense constructs to control viral gene expression in infected cells and tissues and to create

Thus invention describes move staphylococus and least The proteins that bind both the alpha and beted fibrinogen chains. The proteins (and their encoding nucleic acids are CIEB, SdrC, SdrD and SdrE). Staphylococus aureus is thought to utilize fibrinogen to adhere to medical devices, binding proteins that bind both the alpha and beta fibrinogen chains (CIEB, SdrC, SdrD and SdrE) can therefore be used as competitive inhibit cors to blook this binding. Antibodies against CIEB, SdrC, SdrD and SdrE inhibit CIEB, SdrC, SdrD and SdrE mediated binding. The proteins of the invention can be used in a pharmaceutical composition. The proteins of the invention can be used in a pharmaceutical composition. The proteins of the stratechlular matrix. The proteins or their fragments osteomyelitis, mastitis or endocarditis or to inhibit the binding of Staureus to the extracellular matrix. The proteins or their fragments may be used to coat a medical device to reduce the Staureus infection of an indwalling medical device, especially where the medical device is selected from the group consisting of vascular grafts, vascular stents, intravenous catheters, artificial heart valves, and cardiac assist cenconing gene may be used as a vaccine. The DS (aspartate serine) repeat region or a gene encoding it may be used as an identifying probe for the invention have antibacterial activity. The proteins of the invention have antibacterial activity.

The proteins of the invention have antibacterial activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         866 ----QVGSGTDEGIDSNGTSTTGVIKDKDKDVIDSGFYKPTYNLGDYVWEDTNKNGVQD 920
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes novel Staphylococcus aureus fibrinogen-binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Pathogen specific antigen related staphylococcal protein SEQ ID No 124.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             3 VIVIIONGKEMSSTIVSEEDFILPVYKGELEKGYQFDGWEISGF--EGKKDAGYVINLSK

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The invention relates to a novel method for identifying, isolating and producing hyperimmune serum-reactive antigens from a pathogen, tumour, allergen, a tissue or host prone to auto-immunity, where the antigens are used in a vaccine, comprises providing antibody preparation from a plasma pool of a type of animal, or individual sera with antibodies against the specific pathogen, tumour, allergen, tissue or host prone to auto-immunity. The hyperimmune serum-reactive antigens comprising any of the 62 sequences of 53-2261 amino acids fully defined in the more pecification, or their hyperimmune fragments are useful for the manufacture of a pharmaceutical preparation, particularly a vaccine against staphylococcal infections or colonisation against S. aureus or S. epidermidis. The preparation of antibodies is useful for the manufacture of a medicament for treating or preventing staphylococcal infections or colonisation against S. aureus or S. epidermidis. The antibody conditions may also be used for diagnostic and imaging purposes. Other conditions that can be treated include cancer, autoimmune diseases or infections caused by viral (e.g. HIV, hepatitis A, B or C), fungal or protozoan pathogens. This sequence represents a staphylococcal protein relating to the method for identifying and producing pathogen specific antigens of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    819 VIVILKN-----ENGEVLOTIKIDKDGKYQFIGLENGTYKVEFETPSGYIPT--- 865

The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are genes themselves and the encoded proteins. The prokaryotes used are communiae, Pseudomonas aeruginosa and Enterococcus facealis. The invention is also useful for the identification of potential new targets invention is also useful for the identification of potential new targets or identify proteins used in proliferation, to express these proteins. The proteins can be used to screen compounds in rational drug discovery and to obtain antibodies capable of binding to the expressed proteins. The proteins can be used to screen compounds in rational drug discovery comported in proliferation in the proteins are required for cell proliferation in a wide variety of organisms. The present sequence represents an essential prokaryotic cellular proliferation protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ઠે
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      요
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to antisense inhibitors of genes essential to prokaryotic cellular proliferation, their use in identifying the genes, their use in the discovery of novel antibiotics, the essential genes themselves and the encoded proteins. The prokaryotes used are bacherichia coli, Staphylococcus aureus, Salmonella typhi, Klebsiella pneumoniae, Pseudomonsa aeruginosa and Enterococcus faecalis. The invention is also useful for the identification of potential new targets for antibiotic development. The antisense nucleic acids can also be used to identify proteins used in proliferation, to express these proteins, and to obtain antibodies capable of binding to the express choteins. The proteins can be used to screen compounds in rational drug discovery programmes. The antisense mucleic acid sequence is also useful to screen for homologous nucleic acids which are required for cell proliferation in a wide variety of organisms. The present sequence represents an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Carr GJ;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             οŧ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             essential prokaryotic cellular proliferation protein.
Note: The sequence data for this patent did not form part

                                                                                                         invention also provides the SCNBA encoding gene sequence and an antibody against the sodium channel. The SCNBA protein alpha subunit and its encoding cDNA can be used in the elucidation of the physiological mechanisms of excitatory cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    37 QFDGWEISGFEGKKDAGYVINLSKDTFIKPVFKKIEEKKEEENKPTFDVSKKKDNPQVNH

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Ridley R.G., Kilbey B.J.;
"The gene encoding topoisomerase II from Plasmodium falciparum.";
Nucleic Acids Res. 22:2547-2551(1994)
-!- FUNCTION: CONTROL OF TOPOLOGICAL STATES OF DNA BY TRANSIENT
BREAKAGE AND SUBSEQUENT REJOINING OF DNA STRANDS. TOPOISOMERASE II
MAKES DOUBLE-STRAND BREAKS.
-!- CATALYNIC ACTIVITY: APP-dependent breakage, passage and rejoining
of double-stranded DNA. -!- SUBCELLULAR LOCATION: Nuclear.
-!- MISCELLANEOUS: EUKARYOTIC TOPOISOMERASE I AND II CAN RELAX BOTH
NEGATIVE AND POSITIVE SUPERCOLLS, WHEREAS PROKARYOTIC ENZYMES
RELAX ONLY NEGATIVE SUPERCOLLS.
-!- SIMILARITY: Belongs to the type II topoisomerase family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    26;

"Cloning of human microtuble-associated protein 1B and the identification of a related gene on chromosome 15.";

Genomics 22:273-280(1994).

-! FUNCTION: THE FUNCTION OF BRAIN MAPS IS ESSENTIALLY UNKNOWN.

PHOSPHORYLATED MAPIB MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES THAT ACCOMPANY NEURITE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST TWO TUBULIN SUBUNITS IN THE POLYMER, AND THIS BRIDGING OF SUBUNITS MIGHT BE INVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         SUBUNIT: 3 DIFFERENT LIGHT CHAINS, LC1, LC2 AND LC3, CAN ASSOCIATE WITH MAP1A AND MAP1B PROTEINS.

DOWAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAP1B to microtubules.

PTM: LC1 is coexpressed with MAP1B. It is a polypeptide generated from MAP1B by proteclytic processing. It is free to associate with both MAP1B and MAP1B. It interacts with the amino-terminal region of MAP1B (By similarity).
                                                                                                                                                                                                                                       01-NOV-1995 (Rel. 32, Created)

-!- FUNCTION: DNA GYRASE NEGATIVELY SUPERCOLLIS. CLOSED CIRCULAR DOUBLE. STRANDED DNA. IN AN ATP-DEPENDENT MANNER AND ALSO CATALYZES THE INTERCONVERSION OF OTHER TOPOLOGICAL ISOMERS OF DOUBLE-STRANDED DNA RINGS, INCLUDING CATERANDES AND KNOTTED RINGS.
-!- CATALYTIC ATP-dependent breakage, passage and rejoining of double-stranded DNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         4 TVTIQNGKEMS-STIVSEEDFILPVYKGELEKGYQFDGWEISGFEGKKDAGY-VINLSKD

                                                                                                                                                                                                                            SUBGINIT: 3 DIFFRENT LIGHT CHAINS, LCI, LC2 AND LC3, CAN ASSOCIATE WITH MAPLA AND MAPLE PROTEINS.

MOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPLE to microtubules.

PRIM: LCI SCORENERSEED WITH MAPLE. IT IS APLYPEPTIDE GENERATED PROM MAPLE BY PROTEGULYIC PROCESSING. IT IS FREE TO ASSOCIATE WITH BOTH MAPLE AND MAPLE. IT INTERACTS WITH THE AMINO-TERMINAL REGION
                                                                                                            J. Cell Biol. 109;3367-3376(1989).

-!- FUNCTION: THE FUNCTION OF BRAIN MAPS IS ESSENTIALLY UNKNOWN.

-PHOSPHORYLATED MAPLE MAY PLAY A ROLE IN THE CYTOSKELETAL CHANGES

THAT ACCOMPANY NEURITE EXTENSION. POSSIBLY MAPIB BINDS TO AT LEAST

TWO TUBLILIS SUBUNITS IN THE POLYMER, AND THIS BRIDGING OF SUBUNITS

MIGHT BELINVOLVED IN NUCLEATING MICROTUBULE POLYMERIZATION AND IN

STABILIZING MICROTUBULES.

SEQUENCE FROM N.A.
BODOTIN-Fukuhara M., Daignan-Fornier B., Dang D.V.,
Valens M.;
Submitted (JUL-1996) to the EMBL/GenBank/DDBJ databases.
-!- FUNCTION: May function in the processing and/or trafficking of
-nuclear mRNA. May be involved in general transcription as well.
Possesses 5'->3' exoribonuclease activity degrading poly(A) to
                                                                                                                                                                                                                                                                                                                                                                                                  MEDLINE=93109318; PubMed=8417335; Sefana M., Stevens A., Stevens A., McCammon M., Douglas M.G.; McCammon M., Ban essential yeast gene with homology to the exonuclease-encoding XRN1/KEM1 gene also encodes a protein with exoribonuclease

-!- FUNCTION: One of the essential components for the initiation of
protein synthesis. Protects formylmethionyl-tRNA from spontaneous
hydrolysis and promotes its binding to the 30s ribosomal subunits.
Also involved in the hydrolysis of GTP during the formation of the
70s ribosomal complex (By similarity).
-:- SUBCELLULAR LOCATION: Cytoplasmic.
-:- SIMILARITY: BELONGS TO THE IF-2 FAMILY.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        4 TVTIQNGKEMSSTIVSEEDFILPVYKGELEK-----GYQFDGWEISGFEGKKDAGYVIN

-!- FUNCTION: THIS PROTEIN SEALS DURING DNA.
RECOMBINATION AND DNA REPAIR NICKS IN DOUBLE-STRANDED DNA.
-!- CARALYTIC ACTIVITY: ATP + {deoxyribonucleotide} (N) + {deoxyribonucleotide} (M) + {deoxyribonucleotide} (M+M).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Length 847;

In rat CNS and PNS during development.";

J. Neurosci. Res. 49:319-332(1997).

I. FUNCTION: The function of brain MAPS is essentially unknown.
Phosphorylated MAPIB may play a role in the cytoskeletal changes that accompany neurite extension. Possibly MAPIB Binds to at least two tubulin subunits in the polymer, and this bridging of subunits might be involved in nucleating microtubule polymerization and in stabilizing microtubules.

I. SUBUNIT: 3 different light chains, LC1, LC2 and LC3, can associate with MAPIA and MAPIB proteins.

C. I. TISSUB SPECIFICITY: Nervous system (spinal cord, brain stem, cerebellum and cerebrum). Not expressed in liver, spleen, kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             -! DEVELOPMENTAL STAGE: In cerebral cortex, spinal cord and sciatic nerve levels are high early in development but decrease during postnatal development and are low in adulte. In dorsal root ganglia levels remain high throughout development.
-! DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.
-! FM: LCI is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by proteolytic processing. It is a polypeptide generated both MAPIB By similarity).
-! GAMTION: A G-terminal fragment of this protein (residues 1597 to CAMTION: A G-terminal fragment of this protein (residues 1597 to CAMTION: A G-terminal fragment of this protein (residues 1597 to

1. FUNCTION: CELL WALL FORMATION. SYNTHESIS OF CROSS-LINKED

PEPTIDOGLYCAN FROM THE LIPID INTERMEDIATES. THE ENZYME HAS A
FENICILLIN-INSENSITIVE TRANSCLYCOSYLASE N-TERMINAL DOMAIN

(FORMATION OF LINEAR GLYCAN STRANDS) AND A PENICILLIN-SENSITIVE
TRANSFEPTIDASE C-TERMINAL DOMAIN (CROSS-LINKING OF THE PEPTIDE
SUBBUNITS) (BY SIMILARITY).

-!- PATHWAY: Peptidoglycan synthesis; final stages.
-!- PATHWAY: PEPTIDAE CELLS.
-!- DEVELOPMENTAL STAGE: EXPRESSION IS CONSTANT DUBLING GROWTH,
DECREASES DURING SPORULATION AND IS INDUCED APPROXIMATELY IS MIN
INTO SPORE GERMINATION.
-!- PTM: THE PRODUCT EXPRESSED FROM THE TRANSLATION OF THE SPECIFIC AMINO
APPEARS AS TWO BANDS ON A GEL (1A AND 18), BUT THE SPECIFIC AMINO
ACID SEQUENCE OF EACH PROTEIN IS UNKNOWN.
-!- MSCELLANBOUG: CELLS ACKING THE PROTEIN REQUIRE INCREASED LEVELS
-!- MSCELLANBOUG: CELLS ACKING THE PROTEIN REQUIRE INCREASED LEVELS
-!- MSCELLANBOUG: CELLS ACKING THE PROTEIN SYNTHESIS: INCREASED LEVELS
-!- PATHY: THE PROTEIN CONTAIN ABNORMAL FTSZ RINGS,
C C CELLS WITHOUT THE PROTEIN CONTAIN ABNORMAL FTSZ RINGS,
